The purpose of the weekly *Influenza Watch* is to summarize current influenza surveillance in San Diego County. *Please note that reported weekly data are preliminary and may change due to delayed submissions and additional laboratory results.*

**Current Week 14 (ending 4/9/2016)**

- 120 new influenza detections reported: *Elevated level*
- 2% influenza-like-illness (ILI) among emergency department visits: *Expected level*
- 0 influenza-related deaths reported this week
- 6% of deaths registered with pneumonia and/or influenza: *Expected level*

Review Shows Best Flu Vaccine Protection Against H1N1 and Type B Viruses

A systematic review and meta-analysis of nearly a decade of influenza studies across the globe show influenza vaccines provided substantial protection against H1N1 strains and against type B viruses. The study also found that vaccination generates lower protection against H3N2 viruses.

The findings are based on a report published last week in The Lancet Infectious Diseases. The research team screened 3,368 studies from 2004 through early 2015 and selected 56 that met strict criteria for assessing vaccine effectiveness (VE) against different flu subtypes.

The researchers determined that pooled VE for the 56 studies was 61% (95% confidence interval [CI], 57%-65%) for pandemic 2009 H1N1, and 67% (95% CI, 29%-85%) for prepandemic H1N1, 54% (95% CI, 46%-61%) for type B, and 33% (95% CI, 26%-39%) for H3N2. Although VE can decline in older adults due to aging of the immune system, the review found that protection against H1N1 and type B was maintained even in the oldest age groups.

Influenza seasons are unpredictable with circulation of different virus subtypes. Seasons with mostly H3N2 viruses tend to be more severe, and H3N2 evolves more rapidly to evade the immune system compared to other flu viruses. Seasonal flu vaccines are updated each year, with two subtypes of influenza A virus (H3N2 and H1N1) and one or two strains of influenza B.

More information on the recent study may be found at: Variable influenza vaccine effectiveness by subtype: a systematic review and meta-analysis of test-negative design studies

Influenza Reporting in San Diego County

Local providers are encouraged to report laboratory positive influenza detections to the County Epidemiology Program by FAX (858) 715-6458. Please fax a Case Report Form and/or a printed laboratory result, and indicate if patient was admitted to ICU or died, and/or is a resident of a congregate living facility.

For questions regarding sending specimens to Public Health Laboratory (PHL), call (619) 692-8500. Click here for the updated PHL PCR Test Request Form. Contact Epidemiology with any questions at (619) 692-8499 or by email to: EpiDiv.HHSA@sdcounty.ca.gov.
