The purpose of the weekly *Influenza Watch* is to summarize current influenza surveillance in San Diego County. *Please note that reported weekly data are preliminary and may change due to delayed submissions and additional laboratory results.*

**Current Week 6 (ending 2/11/2017)**
- 555 new influenza detections reported: *Elevated*
- 6% influenza-like-illness (ILI) among emergency department visits: *Expected level*
- 5 influenza-related deaths reported this week
- 7% of deaths registered with pneumonia and/or influenza: *Expected level*

---

* FYTD= Fiscal Year To Date (FY is July 1-June 30). Total deaths reported in prior years: 68 in 2015-16, 97 in 2014-15, and 70 in 2013-14.
* Previous weeks case counts or percentages may change due to delayed processing or reporting.
* Current FY deaths are shown by week of report; by week of death for prior FYs.
Influenza Watch

Recent studies suggest that influenza vaccine effectiveness (VE) may wane over the course of an influenza season, leading to suboptimal VE during late influenza seasons. A recent study published in Clinical Infectious Diseases examined the association between influenza VE and time since vaccination among patients ≥9 years old with medically-attended acute respiratory illness.

Using data in the US Influenza Vaccine Effectiveness Network pooled from the 2011-12 through 2014-15 influenza seasons, the researchers found decreasing VE with increasing time since vaccination for influenza A(H3N2), influenza A(H1N1)pdm09, and influenza B viruses. Maximum VE was observed shortly after vaccination, followed by a decline in VE of about 7% (absolute) per month for influenza A(H3N2) and influenza B and 6% – 11% per month for influenza A(H1N1)pdm09 viruses. VE remained greater than zero for at least six months for influenza A(H1N1)pdm09 and influenza B and at least five months for influenza A(H3N2) viruses.

The decreasing influenza vaccine protection observed with increasing time since vaccination is consistent with intraseason waning of host immunity, but bias or residual confounding could explain these findings. Given the uncertain timing of influenza activity each season, it is best to get the vaccine when available and to encourage those who remain unvaccinated to get the shot when they can do so.

For more information about the study may be found at: Intraseason waning of influenza vaccine protection: Evidence from the US Influenza Vaccine Effectiveness Network, 2011-12 through 2014-15. More information about influenza VE is available at the Centers for Disease Control and Prevention Influenza Vaccine Effectiveness website.

Anyone who has not gotten a flu shot this year can go to the San Diego Immunization Program website for some locations in the county where vaccine is currently available.

Influenza Reporting in San Diego County

Local providers are encouraged to report laboratory positive influenza detections to the County Epidemiology Program by FAX (858) 715-6458. Please fax a Case Report Form and/or a printed laboratory result, and indicate if the patient was admitted to ICU or died, and/or is a resident of a congregate living facility.

For questions regarding sending specimens to Public Health Laboratory (PHL), call (619) 692-8500. Click here for the updated PHL PCR Test Request Form. Contact the Epidemiology Program with any questions at (619) 692-8499 or by email to: EpiDiv.HHSA@sdcounty.ca.gov.
