The purpose of the weekly *Influenza Watch* is to summarize current influenza surveillance in San Diego County. Please note that reported weekly data are preliminary and may change due to delayed submissions and additional laboratory results.

**Current Week 44 (ending 11/3/2018)**
- 26 new influenza detections reported: *Expected level*
- 2% influenza-like-illness (ILI) among emergency department visits: *Expected level*
- 1 influenza-related death reported this week
- 4% of deaths registered with pneumonia and/or influenza: *Expected level*

† Flu deaths less than 18 years of age are reportable to CDPH.
* At least one case of laboratory-confirmed influenza in a setting experiencing ≥2 cases of influenza like illness (ILI) within a 72-hour period.

---

For more information, please visit the County of San Diego's Epidemiology and Immunization Services Branch website: [www.sdepi.org](http://www.sdepi.org) or contact (619) 692-8499, EpiDiv.HHSA@sdcounty.ca.gov.

---

* Previous weeks case counts or percentages may change due to delayed processing or reporting.

** Includes FYs 2015-16, 2016-17, and 2017-18.

^ Current FY deaths are shown by week of report; by week of death for prior FYs.
High-dose flu vaccine may offer advantages for seniors

The high-dose flu vaccine provided better protection against influenza hospitalization for seniors than the standard vaccine, according to a recent study from the Oregon Public Health Division that matched cases by age, residence, and other factors.

Based on earlier studies comparing vaccines, they noted that the "healthy vaccine" phenomenon can inflate vaccine effectiveness (VE), while an "at-risk vaccinee" bias can deflate VE estimates. This latter bias may particularly apply with a high-dose vaccine targeted a frailer adults. As another way to compare high-dose and regular flu vaccines, the researchers used immunization registry records and hospitalizations for lab-confirmed flu to see how they performed in groups matched by age, gender, residence type, race-ethnicity, provider bias, and zip code.

Using data from the Portland area during the 2016-17 flu season, a simple aggregate comparison of the two vaccine groups showed no VE difference against flu-related hospitalization. However, adding different categories increased VE, with the final analysis of 23,712 matched pairs suggesting that the high-dose vaccine was 30.7% more effective in preventing flu-related hospitalization (95% confidence interval, 8% to 48%).

The researchers suggested that VE studies include matching factors that reflect local geographic areas, age, and other potential provider biases. They concluded, "As a warning, non-matched or overly simple matched VE study designs may substantially under-estimate VE."

The study may be found at: Assessing the effectiveness of high-dose influenza vaccine in preventing hospitalization among seniors, and observations on the limitations of effectiveness study design.

** Season is July 1 - June 30
Influenza Activity Indicator:
The activity levels show how the current week’s ED ILI% (emergency department influenza-like-illness, percent of all visits) compares to the mean, and number of standard deviations above of the mean, of the non-influenza season weeks (CDC disease weeks 27-39) observed from the prior five seasons.

There are 10 activity levels, classified as: Minimal (levels 1-3), Low (levels 4-5), Moderate (levels 6-7), and High (levels 8-10). An activity level of 1 corresponds to when the ED ILI% is below the mean; level 2 corresponds to when the ED ILI% is less than 1 standard deviation below the mean; level 3 corresponds to when the ED ILI% is at least 1 but less than 2 standard deviations above the mean, and so on, with an activity level of 10 corresponding to when the ED ILI% is at 8 or more standard deviations above the mean.

Influenza Reporting in San Diego County

Local providers are encouraged to report laboratory-positive influenza detections to the County Epidemiology Program by FAX (858) 715-6458. Please fax a Confidential Morbidity Report Form, or an Influenza Case Report Form, and/or a printed laboratory result. If known, please indicate if the patient was admitted to ICU and/or died, and/or is a resident of a congregate living facility.

Regarding sending influenza specimens to Public Health Laboratory (PHL) for confirmation, please use the updated PHL Test Request Form and contact PHL at (619) 692-8500 with any questions. Contact the Epidemiology Program by telephone (619) 692-8499 or email to EpiDiv.HHSA@sdcounty.ca.gov with questions regarding influenza data.
